

JMYT-258US

- 3 -

6 cause poisoning of the catalyst, wherein the combustion management means is effective
7 to modulate the air/fuel ratio (λ) in pulses to 0.90 or richer to provide a series of peak
8 enrichments of from 250 milliseconds to 5 seconds in duration for an aggregate time of
9 from 10 seconds to 10 minutes, whereby the catalyst is regenerated.

1 2. (Amended) An engine according to claim 1, wherein the
2 combustion management means is effective to modulate the air/fuel ratio pulses to 0.95
3 or richer.

1 3. (Amended) An engine according to claim 1, wherein the
2 catalyst is an oxidation catalyst.

1 4. (Amended) An engine according to claim 1, incorporating
2 "common rail" fuel injection, programmed to provide in at least one cylinder,
3 such a quantity of fuel post combustion in the main power stroke, so as to reach,
4 in the exhaust gases, λ of 0.90 or richer.

1 5. (Amended) An engine according to claim 1, wherein the
2 catalyst is an oxidation catalyst and the exhaust gas aftertreatment system also
3 includes a particle or soot filter downstream of the catalyst.

1 6. (Amended) An engine according to claim 1, wherein it is
2 fuelled with diesel fuel containing at least 250 ppm sulfur.

1 7. (Amended) A method of regenerating a PGM catalyst
2 poisoned by sulfur in the exhaust gas aftertreatment system of an internal
3 combustion engine, which system does not include a NO_x trap, which method
4 comprising modulating the air/fuel ratio (λ) of the exhaust gases passing through
5 the catalyst to 0.90 or richer to provide a series of peak enrichments of from 250
6 milliseconds to 5 seconds in duration for an aggregate time of from 10 seconds
7 to 10 minutes, whereby the catalyst is regenerated.

1 9. (Amended) Method according to claim 7, wherein the catalyst is
2 in the temperature range 200-500°C, preferably 350-500°C, during regeneration.

Claim 10 has been canceled.
